Aluva, Ernakulam, Kerala

Summary

Frontend Developer focused on React, TypeScript, JavaScript, and accessible, responsive web interfaces. Experienced in building practical applications with authentication, protected routes, REST APIs, Firebase, form validation, and PDF generation. Built and deployed two independent frontend projects, ApplyTrack and Resume Builder, from scratch to live deployment.

Projects

ApplyTrack

React, JavaScript, Firebase, Cloud Firestore, React Router, CSS, Vite

- Built and deployed a responsive job application tracking dashboard using React and Firebase, with authentication and protected routes for user-specific data
- Implemented full CRUD functionality for job applications, including status-based filtering, live search, and dashboard statistics
- Made modals accessible using the inert attribute to confine keyboard and screen-reader focus, with Escape-to-close and ARIA labelling
- Separated loading, empty, error, and offline states to prevent misleading UI during failed network requests, with a retry option for recovery.

Resume Builder

React, JavaScript, CSS, Vite, React PDF Renderer, React Responsive

- Built a multi-step resume builder with section-level validation, a live preview, and PDF export using React and react-pdf-renderer
- Added a skip option for optional sections with state-driven validation, so skipped sections are automatically hidden from both the preview and the PDF
- Implemented bullet-point formatting for project and experience descriptions using regex-based sentence splitting, applied consistently in both outputs
- Designed separate mobile and desktop layouts with reusable components, custom hooks, and utility functions for maintainability.
